THE WHARTON FINANCIAL INSTITUTIONS CENTER

The Wharton Financial Institutions Center provides a multi-disciplinary research approach to the problems and opportunities facing the financial services industry in its search for competitive excellence. The Center's research focuses on the issues related to managing risk at the firm level as well as ways to improve productivity and performance.

The Center fosters the development of a community of faculty, visiting scholars and Ph.D. candidates whose research interests complement and support the mission of the Center. The Center works closely with industry executives and practitioners to ensure that its research is informed by the operating realities and competitive demands facing industry participants as they pursue competitive excellence.

Copies of the working papers summarized here are available from the Center. If you would like to learn more about the Center or become a member of our research community, please let us know of your interest.

Bankruptcy Exemptions and the Market for Mortgage Loans ¹

January 11, 1997

This Draft: June 19, 1998

Abstract: The recent explosion in personal bankruptcy filings has motivated research into whether credit markets are being adversely affected by generous legal provisions. Empirically, this question is examined by comparing credit conditions and bankruptcy exemptions across states. We note that the literature has focused on aggregate household credit, making no distinction between secured and unsecured credit. We argue that such aggregation obscures important differences in forms of credit. Most significantly, property exemptions do not prevent the home mortgage creditor from foreclosing on the home if not fully repaid. This makes it unlikely that the home mortgage lender will be adversely affected by the exemptions. We argue further that some property exemptions may in fact have some beneficial effects for home mortgage lenders. Using both household-level data and state-level data, we show that in the 1990's high exemption levels have not tended to increase mortgage rates or increase the probability of being denied a mortgage.

Acknowledgments: We gratefully acknowledge helpful input from Raphael Bostic, Steven Coate, Arthur Kennickel, Steven Morris, Eric Posner, Nicholas Souleles, Martha Starr-McCluer, Petra Todd and Michelle White. All remaining errors and inaccuracies are ours. The opinions expressed herein do not necessarily represent those of the Federal Reserve Board or its staff.

1. Introduction

Personal bankruptcy is no longer an unusual phenomenon. Personal bankruptcy filings have risen over 500% in the last two decades and there were over 1 million filings in 1996 alone.¹ Moreover, these filing statistics may in fact understate the importance of personal bankruptcy as many more debtors may implicitly use the threat of filing to evade collection efforts by their creditors; it is default and not necessarily bankruptcy which creates losses for creditors (see White and Petropolous (1996)).

The possibility that these changes in bankruptcy patterns may affect the larger market for credit is of obvious importance to economists and the general public. Yet, to date there has been surprisingly little research in this area. In one recent exception, Gropp Scholz and White (1997) used the 1983 Survey of Consumer Finance to test the question of whether differences in state bankruptcy exemption levels affect aggregate household credit.

Aggregate household credit, though, contains both secured and unsecured credit which have very different dispositions in bankruptcy. As a result, the effects of bankruptcy exemptions on aggregate credit may obscure important differences in the underlying components of household credit. In this paper, we argue that much of the conventional wisdom regarding bankruptcy does not apply to secured credit. In particular, we focus on the primary market for household credit -- the market for mortgage loans.

Mortgage loans are (nearly always) fully secured by a combination of collateral, downpayment and mortgage insurance. Over 97% of the secured claims of Savings and Loans and private mortgage companies on bankrupt debtors are fully secured (Sullivan, Warren and

¹Taken from the Administrative Office of the U.S. Courts, *Annual Report of the Director* 1996.

Westbrook (1989).² The mortgage lender has an important legal remedy unavailable to other creditors, namely the right to foreclose on the home. The mortgage lender is senior to bankruptcy exemptions with respect to its collateral.

In addition to approximating fully secured credit, mortgage debt plays a central role in the portfolio of many households. Home mortgage loans represented 68% of the liabilities of households in 1995.³ Mortgage loans are also prominent in bankruptcy; in a sample studied by Sullivan, Warren and Westbrook (1989), 53% of bankrupt debtors were homeowners and, in this group, mortgage loans constitute more than half of their debts.

Below we provide a significantly more detailed examination of the bankruptcy provisions and their relationship to secured credit than typically found in the existing literature. We include this discussion because it is our focus on the institutional arrangements which leads us to different conclusions than those of Gropp Scholz and White (1997).

In particular, the role of the home as collateral and the existence of several legal protections provided to the home mortgage lender in bankruptcy make it unlikely that homestead exemptions could adversely affect the mortgage credit market. In addition, it is possible that the home mortgage lender may gain from these exemptions and bankruptcy. Put simply, many debtors file for bankruptcy precisely so that they can *pay* their mortgage and keep their home by discharging other debts.⁴

Our empirical investigation makes use of both time series and cross-sectional variation.

²As a consequence, while losses on personal loans amounted to about 2% of total, losses on second mortgages were only 0.2% in 1992 (*Installment Credit Report* (1992)).

³See Kennickell, Starr-McCluer and Sunden (1997).

⁴Sullivan, Warren and Westbrook (1989) report that 10% of homeowners in bankruptcy do not even report their mortgages to the court. They estimate that 40% of debtors in bankruptcy reaffirm some form of secured debt.

The Home Mortgage Discrimination Act (HMDA) dataset and the Federal Housing Finance Board's *Rates and Terms on Conventional Home Mortgages* provide cross-sectional data over several years. To our knowledge, this paper is the first to use these large high-quality data sets to study of the effects of bankruptcy.

The remainder of the paper proceeds as follows. Section 2 provides a brief outline of the relevant empirical evidence. Section 3 discusses some aspects of the legal structure of the credit market and some limits to pre-bankruptcy planning. Section 4 presents a framework for examining the effects of property exemptions on the supply of mortgages. Section 5 reports empirical estimates of the importance of exemption levels on the market for housing credit. Section 6 concludes.

2. Existing Evidence

Although bankruptcy is governed by federal law, the states are permitted to set their own exemption policies and have been kind to empirical economists by enacting what seems to be wildly different exemption policies.⁵ Several authors have tested the hypotheses that, by making bankruptcy more attractive, large exemptions should lead to an increase in the filing rate.⁶ White (1987) finds a positive relationship between the size of a state's exemption and the

⁵For example, a bankrupt debtor in Maryland may only use a \$5,500 wildcard exemption to try to keep both his car and his house under Chapter 7. In Texas, a bankrupt debtor may exempt his home regardless of its value as long as it is on a lot of less than one acre (200 acres if outside a municipality) and could potentially exempt automobiles worth \$60,000. Exemptions cover objects as diverse as a leased organ (Delaware) to dead bodies (Rhode Island).

⁶Most of these studies did not address the fact that the exemptions have legal significance both in and out of bankruptcy. We argue below that, despite this oversight, the hypothesis may still be valid.

number of filings that was statistically significant, but weak. Many other scholars find either no statistically significant relationship or even a negative relationship between the generosity of a state's exemption and the number of filings (e.g., Peterson and Aoki (1984), Shiers and Williamson (1987) and Buckley and Brinig (1996)). Hynes (1998) finds that this ambiguity is not resolved by examining panel-data or the quasi-experiment created by the change in the federal exemptions in 1994.

A recent article by Gropp, Scholz and White (1997) (GSW) uses the 1983 Survey of Consumer Finance to test the broader question of whether differences in states' bankruptcy exemption levels affect aggregate household credit (both secured and unsecured). They find that exemption differentials are having a significant effect (see Domowitz and Eovaldi (1993) for opposing arguments). Specifically, GSW find that, when controlling for other factors, relatively large state bankruptcy exemptions are associated with 1) higher probabilities of being denied credit and 2) higher interest rates on automobile loans for low-asset households. Clearly, the GSW paper raises some very important questions.

GSW study the effect of different exemption levels on the probability of being denied credit regardless of whether the credit is secured or unsecured. The Survey of Consumer Finance asks whether the debtor has been denied credit, not whether this credit was secured or unsecured (see Avery, Ellihansen and Kennickell (1988)). Similarly, the quantity of credit and interest rate variables which they examine also aggregate these two kinds of credit.⁷ This assumption is justified by the debtor's ability to "arbitrage assets and debts across categories." The authors suggest that debtors could borrow on their credit cards or obtain a new consumer loan in order to reduce their mortgage. While some debtors certainly do so, this kind of strategy is risky and, as detailed below, there are very real limits to this strategy. More importantly, this

⁷GSW use interest rates from auto loans. These loans are often undersecured in bankruptcy, so their interest rate measure reflects both secured and unsecured credit components.

strategy prejudices the unsecured creditor in favor of the secured creditor. A successful execution of the strategy results in the mortgage holder getting paid while the unsecured creditor bears the loss.

Secured debt and, in particular, mortgage debt is granted very different legal treatment than unsecured debt in bankruptcy. Aggregating these two forms of credit may obscure differential responses to the prospect of bankruptcy. This paper focuses on home mortgages; the effect on unsecured loans is left to future work. In the next section, we provide detailed background on the treatment of mortgage and unsecured debt in bankruptcy.

3. Credit Demand and the Bankruptcy Exemptions Laws

While most states require their debtors to use the state property exemptions, other states allow debtors to choose the federal section 522(d) exemptions. Exemptions protect the assets of a debtor from seizure by creditors. Therefore, this paper considers both the §522(d) bankruptcy exemptions and state property exemptions. If a debtor files under Chapter 7, he will be entitled to exempt the *equity* in his assets up to the value specified in the exemptions. The exemptions may also have significance in Chapter 13 through the “best interests of the creditors” test which states that the creditors are entitled to receive at least as much in Chapter 13 as they would have received in Chapter 7 (section 1325(a)(4) of the Federal Bankruptcy Code). Finally, most state exemptions protect the assets of a debtor even if he does not file for bankruptcy.

3a. The Characteristics of Property Exemptions

Empirical investigations would be much easier if the variation between state property exemptions was based solely on generosity; for example if all states enacted exemptions which allowed the debtor to choose the form of exempt property. Almost half of the states do provide a “wildcard” exemption which allows a debtor to choose at least some of his exemption and

some states have “spillover” provisions in their homestead exemption which allows a debtor without a home to use some of the homestead exemption for other purposes.⁸ However, even in these states the “wildcard” or “spillover” exemptions are but one of many exemptions available to the debtor.

A homestead exemption allows a debtor to exempt the equity in his home and is typically the most generous property exemption available. Despite popular belief, no homestead exemption is truly "unlimited." Those that do not contain a dollar limit contain a limit on the lot size. Although some of these limits are quite large for rural areas, it is quite easy to imagine that the limitation becomes binding for wealthier debtors in towns, cities or villages. For example, in Arkansas a debtor claiming an exemption in a city, town or village can obtain an unlimited exemption only if his homestead is under 1/4 of an acre. If the homestead is between 1/4 and 1 acre, the homestead exemption is limited to \$2,500. No homestead may exceed 1 acre in a city, town or village. Apparently those debtors owning more than 1 acre in the town must choose the second option of up to \$1,250 in equity if married; an amount which is not scandalously large. Of course, a home on 1/4 of an acre may still be worth quite a bit and many of the homestead exemptions, including those with a specific dollar limit, are so valuable relative to the assets of the debtor as to be effectively unlimited.

An additional complication is that the exemption often depends on the characteristics of the debtor. For example, some states allow married debtors filing jointly to each claim a homestead exemption while other states do not. Some states, such as Massachusetts, offer substantially increased exemptions for senior citizens while other states such as Utah and Virginia offer exemptions which depend on the number of dependents that a debtor has. Finally,

⁸A "wildcard" exemption is available in 24 states and the District of Columbia. However, in 18 of these states the exemption is below \$1,000.

as mentioned above, the exemption may depend critically on whether a debtor lives in a rural or urban area.

When examining personal property exemptions, the first thing that one will notice, even before the generosity of some exemptions, is that most states offer exemptions that are highly specific and complex. A quick glance at the tangible personal property that can be exempted in Texas will illustrate this point. In Texas the debtor may exempt "athletic and sporting equipment, including bicycles; 2 firearms; home furnishings, including family heirlooms; food; clothing; jewelry (not to exceed 25% of total exemption); 1 two-, three- or four-wheeled motor vehicle per member of the family or single adult who holds a driver's license . . .; 2 horses, mules or donkeys and a saddle, blanket and bridle for each; 12 head of cattle, 60 head of other types of livestock; 120 fowl; pets and tools, equipment & books to \$30,000 total (\$60,000 for head of family) (Elias, Renauer and Leonard (1995)). With all of this incredible specificity, the personal property exemption is substantially more difficult to quantify than the homestead exemption.

Because of these complications, one cannot develop a "correct" method of coding property exemptions, a situation reflected by the fact that, to our knowledge, no two papers in this area employ the same method. Indeed, GSW themselves use one measure of exemptions when studying the probability that an individual will be denied credit and a different measure when studying the effect on the quantity of credit and the interest rate. Acknowledging the potential for subjectivity, we employ multiple coding methods to insure that our results are not sensitive to the specification chosen.

The difficulties in coding the exemptions are most severe with the personal property exemptions. Many states place no dollar limit on the amount of some forms of personal property that may be exempted but instead rely on words such as "necessary." If one extends GSW's assumption of fungibility to include items such as clothes, furniture or automobiles, many states

will erroneously be seen as providing “unlimited” bankruptcy exemptions. If one ignores exemptions of specific property and focuses solely on the ability to exempt cash, one will overstate the relative generosity of states that rely heavily on the wildcard exemption. One could specify dollar values for what is “necessary,” but this raises serious questions about the source of the values chosen. Indeed, the exemptions may be designed to prevent the store of wealth and make resale difficult.

3b. Bankruptcy Planning

Bankruptcy planning does take place. However, we stress that such planning is limited and that many debtors are unable to fully utilize the exemptions as provided by law.⁹ There are both legal and practical reasons for this. First, while creditors may unwittingly lend some money to debtors in financial distress, they are unlikely to grant such debtors unlimited credit. Second, there are several provisions of the bankruptcy code designed to prevent abuse of the system which, although not perfect, probably have a real effect on the ability of a debtor to “plan” for bankruptcy. The provisions we discuss below prevent a debtor from accumulating enough assets to maximize the exemptions and prevent a debtor from converting all of the assets that he does have into exempt form.

If a court finds behavior which suggests that the debtor has borrowed with no intention of ever repaying, as suggested by GSW, the courts may deny the bankruptcy petition on the grounds that it was fraudulent (Section 727) or a “substantial abuse” (Section 707(b)) of the system. Charging one’s credit cards to the limit to obtain exempt assets is not necessarily a wise strategy either as debts incurred when there is no possibility to repay are non-dischargeable.

⁹As discussed above, our premise is not that pre-bankruptcy planning is impossible or unimportant. Indeed, one commonly cited form of planning, paying down the mortgage, may benefit the mortgage lender.

Some credit card companies make use of this provision by routinely examining the bankruptcy filings of their debtors to determine the date of insolvency. They then challenge all debts incurred after this date (Elias, Renauer and Leonard (1995)). When they do challenge a debt, the banks have a fairly high success rate, between 38% and 48% (Installment Credit Report (1992)).

Both the provisions of the code that are designed to prevent "abuse" of the bankruptcy process and the design of the exemptions themselves work to prevent many debtors from reaching the dollar limit of each form of exempt property. That is, many exemptions explicitly give judges discretion over what the debtor is entitled to keep in order to prevent the debtor from using exempt property as a store of wealth. For example, exemptions which relate to common forms of personal property generally require that the exempt property be "reasonably necessary" for the debtor's livelihood or that the property be for the actual use of the debtor.¹⁰ Finally, a debtor's attempt to use the exemptions to store wealth in liquid assets can result in a denial of the exemption or even a denial of the discharge if the court feels that this was indicative of an attempt to "hinder, delay or defraud a creditor" (*In re Armstrong*, 97 B.R. 569, 570 (Bankr. Neb. 1989), *aff'd* 931 F.2d 1233, (8th Cir. 1991)).¹¹

The vast majority of debtors do not maximize the theoretical exemption.¹² The fact that

¹⁰In California, the exemption includes personal effects that are "ordinarily and reasonably necessary to, and personally used or procured for use by" the debtor or his family. Further, if an item has "extraordinary value" relative to that deemed necessary, the court can order the item sold and allow the debtor the "reasonable" portion of the proceeds.

¹¹For related research, see Sieger, Vadner and Watkins (1994).

¹²As of 1981, the median asset value of bankrupt debtors in Illinois, Texas and Pennsylvania was \$14,000. In all three of these states, a couple in bankruptcy could have exempted more than this amount in the homestead alone (Sullivan, Warren and Westbrook (1989)).

many debtors who would apparently gain from these strategies neither file nor default, appear to suggest that the anti-abuse provisions are to some extent effective. This may help to explain the findings of White and Petropoulos (1996) who note that far *more* bankruptcies should be observed given the nominal exemptions levels.

3c. Other Consumer Credit Laws and Regulations

It is important to remember that the mortgage creditor retains the right to foreclose if he is not repaid in full; the mortgage is senior to the exemption with respect to the home. Moreover, the mortgage creditor is immune to several bankruptcy provisions which threaten other secured creditors or other lien-holders. For example, unlike other forms of secured credit, the mortgage is not split into secured and unsecured credit components by Section 506 and thus a debtor desiring to retain possession of his home must either convince the mortgage creditor to allow him to reaffirm the debt or pay the mortgage creditor in full. Likewise, the mortgage creditor is not affected by Section 1322(b)(2) which allows the debtor to reschedule payments in Chapter 13 according to a judicially determined interest rate. Finally, the debtor cannot make use of the lien avoidance provisions of Section 522(f) for a mortgage contract.

Most of the states which have opted out of the federal exemptions have adopted state exemptions so generous that it appears a debtor is unlikely to choose the federal exemptions for reasons other than administrative convenience. Therefore, it is safe to say that *state* property exemptions are the dominant form of exemptions in bankruptcy. Most of these exemptions continue to have significance outside of bankruptcy. Much like their operation in bankruptcy, a general creditor may only seize a debtor's property if the debtor has non-exempt equity in that asset. Again like bankruptcy, the exemptions do not affect the right of a mortgagee to seize his collateral if he is not repaid in full. Although the exemptions protect the debtor's assets equally

whether or not he has filed, their value is enhanced by the discharge available in bankruptcy and the lien avoidance provisions of Section 522(f). In the absence of bankruptcy, the debtors assets are only protected so long as they remain in exempt form.¹³

Property exemptions are but one part of debtor/creditor law. Just as the exemptions vary across states, there is a fair amount of state-level variation in other aspects of the law which could directly affect the price and quantity of credit. A few examples will illustrate this problem. Until 1997, Texas all but prohibited second mortgages through the very same statutes which create the exemptions. California prohibits mortgage lenders from seeking recourse against their debtors if foreclosure fails to generate sufficient assets to satisfy the debt. Several other states allow a debtor (or junior creditor) to redeem the home even after it has been sold at an auction. In addition, the states have adopted varying restrictions on the ability of a creditor to garnish his debtors wages.

While the above statutes could be used to form additional legal variables, they are beyond the scope of this paper. Rather than attempt to specify all legal and cultural variables that might affect the credit market, we rely on the use of cross-sectional and time series variation to control for some of these unmeasured effects.¹⁴

For all of the reasons discussed above, we believe that the effect of the exemptions on the demand for mortgages is likely to be limited. To the extent that property exemptions do affect

¹³Some exemptions protect the proceeds from a sale of exempt property for a period in order to allow the debtor to convert the proceeds into another form of exempt property. See, for example, HI Rev Stat 36-651-96.

¹⁴If omitted legal variables changed at the same time as the exemptions levels, our results would be biased. At least for wage garnishment laws, however, we know that almost no changes took place during our sample period.

the market for home mortgage loans, we expect the effect to change the supply of mortgages. We readily admit that we cannot rule out the possibility of a demand shift. However, we think that this is unlikely to cloud the results for three important reasons. First, the vast majority of debtors are unaware of the magnitude of their state's exemption *at the time of borrowing*. Although they may learn of the exemption after they enter into a time of financial distress, very few will know their state's exemption or even contemplate its use at the time that they borrow. Second, if capital is mobile across states so that supply is flat in any one state, demand shifts will not affect equilibrium terms of credit unless the type of debtor changes. Finally, even if a demand shift changes the type of debtors who apply for a loan, the HMDA data set provides detailed information on the individuals who apply for the loan and we are able to control for this potential problem to a certain extent.

4. Exemptions and the Supply of Credit

Before providing a more detailed analysis of the effect of the exemptions on the supply of home mortgage loans, we reiterate the basic thrust of this paper; exemptions are unlikely to have a significantly negative impact on the supply of home mortgage loans precisely because of their status as a secured loan. This can be most clearly seen by examining a world with no transactions costs. The mortgage creditor should be completely indifferent toward the homestead exemption as it will not affect his right to foreclose on the home if not paid in full. While somewhat obvious, we believe that this point has been overlooked in the literature and has important empirical implications. The mortgage lender might take a negative view of other exemptions (personal property). This is so because, if the mortgage lender cannot fully satisfy her claim by seizing the house, she would like to go after personal property. Large personal property exemptions prevent this. Note, however, that this effect is only important if the home mortgage lender is significantly undersecured. As noted in the introduction, empirical evidence

suggests that large shortfalls are atypical.

We now consider the presence of transaction costs to determine if there are secondary effects which alter the analysis. Specifically, assume that the home mortgage lender will incur some non-reimbursable costs if there is a forced sale of the debtor's home. Larger exemptions may induce the debtor to choose to file for bankruptcy and default on his unsecured loans thereby increasing the debtor's wealth. In addition, a larger homestead exemption may reduce the required repayment in a Chapter 13 bankruptcy again leading to a wealth effect. This wealth effect may prevent a default and save the lender the non-reimbursable costs. Larger homestead exemptions may also induce the debtor to choose Chapter 7 over Chapter 13. We argue below that Chapter 7 is likely to pose lower costs for the home mortgage lender. A larger homestead exemption will make it less likely that there will be a foreclosure sale.

Larger personal property exemptions may also have a beneficial effect because of the wealth effect. That is, if a debtor reaffirms the mortgage, the mortgage holder benefits from larger exemptions as they make the debtor wealthier and hence better able to continue to meet the payments. However, this must be balanced against the effect on the deficiency judgment and the debtor's incentives to engage in pre-bankruptcy planning; the mortgage creditor may prefer the debtor to have a large homestead exemption and small personal property exemption to encourage him to repay his mortgage before filing for bankruptcy. Therefore, the effect of the personal property exemptions is theoretically uncertain.

To evaluate these potential effects more explicitly, we employ a framework in which we first focus on the debtor's choices of whether or not to repay his loans and whether or not to file for bankruptcy. Once this is specified we focus on the return to the mortgage lender.

4a. The Debtor's Decision

Although the majority of papers addressing property exemptions have focused on the

filing decision, no clear model of the debtor's filing decision has emerged. While we do not seek to fill this void here, we do need to address the issue in order to examine the effect of the exemptions on the return of the secured creditor. We assume that the debtor will have four general alternatives: repay all of his creditors in full, default on his unsecured loans and force the creditors to use state collections proceedings, file under Chapter 7 or file under Chapter 13 of the bankruptcy code.¹⁵ We assume throughout that the debtor may only keep his home if he repays his mortgage creditor in full; the mortgage creditor will not renegotiate the mortgage.

There are several reasons why the probability of filing for bankruptcy should depend on the exemptions. First, the exemptions may be larger in bankruptcy than in simple default. For example, some states allow filers to use the federal bankruptcy exemptions which may be larger than the state exemptions. In addition, some states, such as California have state exemptions that apply only in bankruptcy. More importantly, bankruptcy permanently discharges debts and avoids certain liens. As a result, after bankruptcy the debtor is able to convert his exempt wealth into any form he likes without fear of seizure by creditors. He will no longer have to fear attachment by general creditors and those liens which were attached before bankruptcy.¹⁶ Rather

¹⁵We do not consider the choice of defaulting on the mortgage and repaying the unsecured loans. Because we assume that the mortgage lender has the right to a deficiency judgment, he has the right to be treated equally as the unsecured creditors.

¹⁶Some state exemptions allow attachment of the debtor's property even though they do not allow foreclosure and sale of the property. For example, Section 41.001 of the Texas Property Code only explicitly prohibits the "seizure [of a homestead] for the claims of creditors." This language has resulted in some ambiguity. Some courts have held that no lien can attach the homestead. *Hoffman v. Love*, 494 S.W.2d 591, 593-94 (Tex. Civ. App.-Dallas 1973), writ ref'd n.r.e. per curiam 499 S.W.2d (Tex. 1973); *Harms v. Ehlers*, 179 S.W.2d 582, 583 (Tex. Civ. App.-Dallas 1944, writ ref'd). However, other, more recent, cases have found that an unenforceable lien attaches. See *Exocet, Inc. v. Cordes*, 815 S.W.2d 350 (Tex. App.- Austin 1991, no writ.) These liens may, however, "place a cloud on the debtor's title" and thus are avoidable in bankruptcy." *In re Henderson*, 18 F.3d 1305, 1310-11 (5th Cir. 1994).

than trying to be more explicit about the decision to file, we assume that the debtor will file with some probability that depends on the level of garnishment permitted, the exemptions, the value of his home and the value of his human capital, $b(g, X_h, X_p, h, k)$, where g is the fraction of future income which is exempt from garnishment, X_h and X_p are the homestead and personal property exemptions, h is the value of the house and k is the debtor's human capital (equivalently, future income).¹⁷ Note that some of the anti-abuse provisions of the bankruptcy code may deny the debtor access to bankruptcy. In these circumstances the probability of filing is simply zero.

To simplify notation, throughout the discussion we assume that the personal property exemption is binding, $P > X_p$, where P is personal property. The distressed debtor's exempt personal property is thus always equal to X_p . This assumption has no effect on the model's implications for changes in X_h . However, without this assumption, marginal changes to X_p may have zero effect on the lender.

Default outside Bankruptcy

Consider a debtor who decides not to repay his unsecured creditors but does not file for bankruptcy. His unsecured creditors (including the mortgage creditor if there is a deficiency judgment) will have the right to garnish his wages and seize any non-exempt property in satisfaction of their debt. In order to retain his home, the home equity (plus subjective value) must be worth more than the debt but not so valuable that the equity exceeds X_h . If the equity exceeds X_h , any creditor can demand the excess equity and thereby force a sale of the house. If the value of the home (including the subjective value) is less than the value of the mortgage, a debtor defaulting on his unsecured debt would have no reason to repay his mortgage. That is, he

¹⁷The federal garnishment exemption is the greater of 75% or thirty times the minimum wage per week.

will retain his home if $M - v < h < M + X_h$, and $gk + X_p > M$, where v is the subjective value of the home and M is the amount of the mortgage loan.

Chapter 7

Now consider a debtor filing under Chapter 7. The mortgage creditor must be repaid in full if the debtor is to retain the home. The debtor may only do so if he has sufficient assets, other than the home, to repay the debt in full, $k + X_p > M$. By filing for bankruptcy the debtor has more wealth available for repayment as he is no longer subject to garnishment or the other pressures that the unsecured creditors can place on a delinquent debtor. As with simple default, the equity must be enough to make reaffirming the mortgage rational but not so much that it exceeds the exemption, $M - v < h < M + X_h$. If both of these conditions are met, the debtor's consumption is $X_p + h - M + v + k - T_7$ where T_7 represents the debtor's transactions costs in Chapter 7. If one of these conditions is not met, the debtor will lose his home in a chapter 7 bankruptcy and his wealth will be $X_p + \text{Min}[X_h, h - M] + k - T_7$.

The transactions costs of Chapter 7 are likely to be much different than those of default outside of bankruptcy and their size is likely to depend on the individual characteristics of the debtor and the community in which he lives. The debtor will have to pay a filing fee and may need to hire a lawyer. In addition, the debtor may face an additional stigma beyond what he would have faced had he simply defaulted. However, the automatic stay will protect the debtor from unwanted collections calls and the anti-discrimination provision of Section 525 may provide some comfort as well. From a theoretical level it is unclear whether a bankruptcy appears worse or better on the debtor's credit record than default in the absence of bankruptcy. If a debtor files for Chapter 7 he will be unable to do so again for six years. This has lead some

scholars to assert that bankrupt debtors are good credit risks.¹⁸ However, a bankruptcy filing may signal a greater willingness to default.

Chapter 13

The debtor may also file for bankruptcy under Chapter 13. Under Chapter 13 the debtor is permitted to retain all of his physical assets, including his non-exempt property, but must in return pay some of his future earnings. Two important considerations arise. First, the creditors must receive at least as much as they would have received in a Chapter 7 filing. Therefore the debtor must pay at least $(P-X_p)+\text{Max}[0, h-M-X_h]$ to his unsecured creditors. Second, the debtor must pay all of his “disposable income.” This second provision may be less strict than it would appear. Basically, this provision provides that the debtor’s budget may not contain “luxuries unavailable to the average American.”¹⁹ We will assume that the additional amount depends on the value of his future earnings, $R_{13}(k)$.

As always, the mortgage creditor must be repaid if the debtor is to keep the home. In addition, the unsecured creditors can seize the home if the debtor does not pledge sufficient income to offset any non-exempt equity. Therefore, in order to retain the home the debtor must repay at least $P-X_p + \text{Max}[M, h-X_h] + R_{13}(k)$.

The foregoing discussion suggests one immediate conclusion. The debtor will always have to make greater payments in Chapter 13 than in Chapter 7. Therefore, assuming that the

¹⁸For example, Frank (1996) reports, “Prof. Warren says some credit-card issuers actually review bankruptcy filings in search of potential customers. Their logic is simple: the law doesn’t allow people to file for [a Chapter 7] bankruptcy more than once every six years. Thus, the recently bankrupt are, in some sense, perfect debtors – they can’t just walk away from their debts.”

¹⁹Collier’s 1325-53, 1325.08[4](b) citing *In re Tinneberg*, 59 B.R. 634 (Bankr. E.D. NY 1986); *In re Hedges*, 68 B.R. 18 (Bankr. E.D. VA. 1986).

transactions costs of Chapter 13 are at least as high as Chapter 7, a debtor would only file under Chapter 13 if, by doing so, he can keep his house. This occurs when his equity position is above the legal exemption and his future income is high enough to meet the Chapter 13 payments, $h > M + X_h$ and $k > h - X_h - X_p + R_{13}$.

Repayment

If the debtor repays his unsecured creditors his return is simply $h + v + k - U - M$. Given the above, it is clear that his filing decision will depend on the value of his home, his human capital, the exemptions, the garnishment limitation and the relative transactions costs. We define $K_d(h, X_h, X_p, g, R_{13})$ as the level of human capital above which the debtor will repay his creditors in full.

4b. The Return to Mortgage Lender

In a world without transactions costs, the size of the homestead exemption would have no effect on the return to the home mortgage lender. The home mortgage lender is senior to the exemption. However, a mortgage creditor is likely to face non-trivial transactions costs when dealing with distressed debtors. We consider three distinct forms of transactions costs. The first are foreclosure costs such as lawyers fees and running an auction. The creditor is entitled to reimbursement for these costs from the proceeds of the sale and we denote these costs Q_7 when foreclosure occurs in Chapter 7 and Q_n when it occurs outside of bankruptcy. It is likely that $Q_7 < Q_n$. It is true that bankruptcy may delay foreclosure. However, this delay is unlikely to be long and a fully secured mortgage lender is entitled to interest payments.²⁰ Some have asserted that bankruptcy provides a better system for foreclosure and sale.

²⁰Elias, Renauer and Leonard (1995) describe delays on the order of an additional month.

For example, Lopucki (1991) argues that bankruptcy provides better mechanisms for gaining information on the debtor in order to determine whether to foreclose, makes it easier to prevent abuse of the property, allows for liquidation free and clear of other liens, cuts-off the “right of redemption” (which allows the debtor to make good on the mortgage for up to 6 months), and allows the lender to bypass state anti-deficiency legislation. In addition, the debtor has an incentive to comply with the legal proceedings in order to secure his discharge.

Even in the absence of a foreclosure, these costs within bankruptcy are not likely to be much higher than under state collections proceedings. The debtor has chosen to reaffirm the debt and will make the payments on a regular schedule. Therefore, the mortgage creditor need not participate heavily in the process. In fact, many debtors do not even list their mortgage creditor making their participation completely unnecessary (e.g., Sullivan, Warren, and Westbrook (1989))

Other significant non-reimbursable costs are those associated with continuing a debt contract with a distressed debtor. These costs are taken to be inversely proportional to wealth. The costs incurred by the mortgage lender are summarized in the first row of Table 1. Unless the relationship with the debtor is ended through foreclosure, costs are a function of the debtor’s wealth.

Rows 2-4 of Table 1 show the returns to the lender from mortgage payments, foreclosure sales and from deficiency judgements (when the debt cannot be covered by sale of the home). The mortgage lender gets a fraction of the debtor’s property from a deficiency judgement; the fraction is equal to the housing debt divided by total debt. The bottom row indicates the net return for each possible debtor action, with $F_7(h)$ and $F_n(h)$ denoting the returns from foreclosure and deficiency.

As mentioned above, we allow the debtor’s decision to repay all of his debts to depend on the level of garnishment allowed, the exemptions, the value of his home and the value of his

human capital. Full repayment will occur when $k > K_d(g, X_p, X_h, h)$.

Given this accounting framework, we can write an explicit expression for the expected return from a mortgage conditional on the probability densities of future home and human capital values. Let the expected return, detailed in the appendix, be denoted $E(R)$.

In order to determine the effect of an increase in the homestead exemption, we need only evaluate the sign of the derivative of the return with respect to X_h . First we make the following assumptions about the magnitude of relative transactions costs.

Assumption 1

Foreclosure is less costly under court supervision, $C_{7f} < C_{nf}$.

Assumption 2

Reaffirmed mortgages are less costly than foreclosures, $C_{13} < C_{nf}$, $C_{13} < C_{7f}$, $C_{7r} < C_{7f}$ and $C_{nr} < C_{nf}$.

Assumption 3

Mortgage lenders prefer that the debtor file under Chapter 13 and thereby partially discharge the unsecured debt rather than repay the unsecured debt in full, $C_{13} < C_r$.

Assumption 4

Debtors with non-exempt equity in their home and a relatively high value of human capital are likely to file under Chapter 13 to avoid foreclosure; $b(g, X_h, X_p, h, k)$ is close to one in this region.

Assumption 3 is reasonable in that any discharge increases the wealth of the mortgage holder. Assumption 4 asserts that debtors who face good job prospects, but are unable to meet all their current debt payments, are likely to file Chapter 13 in order to keep their houses. As detailed above, there is both empirical and anecdotal support for a high probability of Chapter 13 in these circumstances.

Proposition 1

Under assumptions 1-4, the expected mortgage return to the lender is increasing in the homestead exemption, $\frac{\partial E(R)}{\partial X_h} > 0$.

Proof

See Appendix 1.

Proposition 2

Under assumptions 1-4, the effect of marginal increases in personal property exemptions are theoretically ambiguous. Specifically, they will depend on the relative magnitudes of the beneficial wealth effect on the debtor versus the detrimental effect of the decreased ability to seize the debtor's personal property (deficiency judgements). That is, the sign of $\frac{\partial E(R)}{\partial X_p}$ is theoretically indeterminant.

Proof

See Appendix 1.

Proposition 1 immediately suggests a correlation between homestead exemptions and favorable supply conditions. Following Stiglitz and Weiss (1981), Longhofer (1996), and Williamson (1986, 1987), we note that a shift in the supply of credit may manifest itself in reduced credit rationing or lower interest rates. Intuitively, changes to the interest rate may not necessarily clear the market because they have effects on the type of loan and the probability of repayment. For example, higher interest rates will 1) decrease the ability of a given debtor to repay; 2) change the pool of applicants by decreasing the number of high quality applicants and 3) cause some debtors to engage in riskier behavior. Longhofer (1996) explicitly examines the effect of exemptions on the probability of denial in a costly state verification model. He shows that if one considers credit generally, larger exemptions should lead to greater credit rationing as

the creditors cannot make up for the reduced return in default by increasing the interest rate.

This result is not robust to the inclusion of secured credit. It is unlikely that homestead exemptions will reduce the return to the mortgage lender when the debtor is in financial distress. Indeed, proposition 1 implies that larger homestead exemptions should lead to lower interest rates and reduced credit rationing. However, it is possible that personal property exemptions will increase credit rationing.

5. Empirical Tests and Results

We first investigate whether the probability of being denied credit, in the form of a mortgage, is increasing in the homestead or personal property exemption level. The Home Mortgage Discrimination Act (HMDA) data contains a summary of every mortgage application taken by qualifying mortgage lenders in the United States from 1990-1995. Because of the enormity of this data set (about 3.8 million in 1995 alone), we select a random subset of approximately 100,000 applications per year. Each application contains information on the type of loan (conventional, FHA or VA), the purpose of the loan, the outcome (approved, denied or incomplete), as well as the race, gender and location of applicant and any co-applicants. We exclude FHA, VA and Farmers' Home Administration loans. We also exclude home improvement loans. Each application includes the income, race, sex, and state of residence of the applicant and co-applicant (if any) as well as the size of the loan requested and the decision of whether the application was accepted or rejected.

We study probability of denial by estimating a logit regression of the form:

$$y_{it} = \alpha_i + \beta_1 X_{h,it} + \beta_2 X_{p,it} + \gamma Z_{it} + \varepsilon_{it}, \quad y_{it} = (0,1),$$

where $y_{it} = 1$ for denied and 0 for approved. Z_{it} is a vector of individual characteristics including the loan-to-income ratio, race, marital status, income, income squared, as well as the state

unemployment rate as a proxy for regional business cycle conditions (taken from the *Selective Access Service* of the Bureau of Labor Statistics).

We assume that the exemption of interest is that available to a debtor who does not qualify for special treatment due to age, infirmity, veteran's status or occupation. Because our analysis predicts that the homestead and personal property exemptions may have very different implications, we construct two measures. First, we construct a measure of the homestead exemption which includes the amount of equity a debtor may exempt as well as any wildcard exemption which may be used on the home. We ignore any limitations on the lot size. This measure is relatively straightforward to calculate. In addition, we construct a measure for the personal property exemptions which again includes any wildcard exemption as well as the equity in a car that a debtor may exempt and the amount of jewels that a debtor may keep other than wedding and engagement rings.²¹ Perhaps surprisingly, the two exemptions categories are statistically uncorrelated, with a point estimate of -0.05.

Given this data, we construct both continuous and dummy variables. If a state has an "unlimited" exemption, we set the exemption variable equal to one million dollars in the continuous analysis.²² We express the continuous variables in units of \$100,000. Our second approach, following GSW, is to group the exemption levels into quartiles with the fourth quartile containing only those states with unlimited exemptions.

We do not make the dubious assumption -- implicit in pooled regressions -- that there are no systematic differences in credit denials, except those related to the regressors. Because states are likely to experience other differential influences (e.g., cultural and legal), we estimate a

²¹Numerous states have unlimited exemptions for wedding and engagement rings.

²²The results in this paper were not sensitive to alternative ceilings such as two million dollars.

fixed-effects model which allows the intercept to vary across states (at the cost of a reduction in degrees of freedom). Therefore, our results are driven by the effects of changes in the state exemptions. Such changes were not uncommon over our sample period.

Table 2 presents maximum likelihood estimates based on the continuous specification of the homestead exemption. Columns 2 to 4 show the coefficients, standard errors and p-values allowing for fixed state effects. The coefficients on the fixed state effects are omitted from the table. The fifth column of the table, labeled standardized estimate, reports the coefficient estimate normalized by the variance.

As predicted by proposition 1, the coefficient on the homestead exemption is significantly negative. The signs of the coefficients associated with the other variables are consistent with what we would expect. The probability of denial appears to decrease with higher incomes, and increases for higher state unemployment rates and larger loan requests. African-american applicants appear to have a higher probability of denial, as do single applicants. The dummy variable for female applicants should be interpreted with caution as this indicates only that the primary applicant was female. Four of five annual dummies are significantly different from zero, suggesting that the overall probability of denial changes markedly from year to year.

Table 3 shows the results based on grouping the homestead exemption into quartiles. Again, the quartiles take the expected negative sign implying that larger exemptions lead to a lower probability of denial as the mortgage lenders *prefer* large homestead exemptions.

In Table 4, we include the personal property exemption in addition to the continuous homestead. The coefficient on the homestead exemption is little altered, remaining significantly negative. However, the personal property exemptions are positively correlated with the probability of denial, although only at a significance level of 75%.

It is possible that the negative coefficient on the homestead exemption is a result of simultaneity bias in the selection of the exemptions -- states with more restrictive credit markets

may choose lower exemptions. Nevertheless, even if this interpretation were accurate, any negative effect that the homestead exemption has on the supply of mortgages is insufficient to overcome the effect of this bias.

We also examine whether, as we have suggested, large bankruptcy exemptions tend to drive down mortgage rates (presumably by encouraging supply). We use annual mortgage rates available to borrowers in each of the 50 states and the District of Columbia. These data are taken from *Rates & Terms on Conventional Home Mortgages, 1995* compiled by the Federal Housing Finance Board.

The coefficient estimates from fixed-effects panel regressions are shown in Tables 5. The top panel of Table 5 reports coefficient estimates from a fixed-effects panel data regression of mortgage rates on the homestead exemption, the unemployment rate and average hourly wage rate from the *Selective Access Service*, annual dummies and the two demographic variables, percentage African-american and percentage senior citizen.²³ Consistent with our hypothesis that supply has increased, the homestead exemption variable enters negatively with a t-statistic of -1.5 or a confidence level of about 87%. Personal property exemption enter insignificantly. An F-test of the joint significance of the random effects indicates a p-value of .00, suggesting strong evidence in favor of differential state effects. In addition, we calculated the Hausman (1978) specification test of random effects model against the alternative of the fixed-effects model. The associated p-value is .52 which indicates no evidence in favor of either.

The lower panel of Table 5 replicates the analysis for the loan-to-value ratio. Although not significant, it is interesting to note that the coefficient on the personal property exemption is -1.1. This is consistent with the estimation of the probability of denial; it is plausible that the personal property exemptions reduce the supply of mortgage loans.

²³Demographic data are available on the internet at <http://www.census.gov/>.

Quite apart from whether bankruptcy exemptions exert a statistically significant effect on credit conditions, are they economically important? Table 6 presents fitted values from the logit regression for typical debtors in four states. The middle panel shows estimated probabilities of denial for white, married consumers in low, middle and high income brackets and median loan-to-income ratios in 1995.²⁴ South Carolina and Delaware are shown in columns 4 and 5. Delaware's exemptions are about twice that of South Carolina. At the same time, the implied probability of denial for South Carolinians is 10% to 15% higher -- a substantial difference. Column 6 shows fitted values for West Virginia which has higher homestead and personal property exemptions compared to Delaware. Given our estimates, denial is noticeably more likely in West Virginia than in Delaware for each income bracket. In Mississippi which allows a homestead exemption ten times that of West Virginia, we estimate that denial is over 10% less likely. Of course, these differences cannot be solely attributed to the exemption levels. The predicted state denial rates condition on fixed state effects which may reflect other cultural and legal variables.

In order to focus on the importance of exemptions in isolation, the bottom panel of Table 6 reports the percentage difference that would be predicted from quadrupling either the homestead or personal property exemption. Clearly, the economic impact from increasing the homestead exemption is small in states with currently small exemptions. This becomes especially apparent when compared to the estimated increase in the probability of denial from quadrupling personal property exemptions.

Turning to mortgage rates, Table 7 shows estimated terms on fixed rate mortgages typical consumers in the same four states. Again the lower panel displays the implied

²⁴Income levels are defined as less than \$24,999, between \$25,000 and \$49,999, and more than \$50,000. Each income category contains roughly one third of U.S. families.

percentage change in the dependent variables that would result from quadrupling either exemption category. As with denial rates, large increases to the homestead exemption imply relatively small changes, less than 1%, of mortgage rates and down payments. A fourfold increase in personal property exemptions, yields mortgage rate and down payment increases in the range of 1 to 5 percent. However, it should be noted that the loan-to-value ratio regressions indicated that these changes are not statistically significant.

On balance, the changes in exemption levels are associated with relatively small changes in the probability of denial and mortgage rates. Nevertheless, these results confirm the essential theme we have outlined -- the mortgage lender is unlikely to be adversely affected by a large homestead exemption.

6. Conclusion

Existing research into bankruptcy property exemptions has found significant adverse consequences for consumer credit markets, raising interest rates and reducing access to credit. We find that these results do not hold for the homestead exemption and the mortgage loan market. Indeed, the probability of being turned down on a mortgage application appears to be marginally reduced as homestead exemption levels increase. In addition, mortgage rates appear to decline with higher homestead exemption levels. The results are reversed if one considers the personal property exemptions.

The discrepancy between the results of our paper and those of the previous research may result from the important differences between secured and unsecured credit. More research is necessary to determine the effects of property exemptions on purely unsecured and undersecured credit. Such research is particularly needed in light of the recent renewed calls for standardized federal bankruptcy exemptions.

The National Bankruptcy Review Commission conducts a periodic review of the

bankruptcy process creating the possibility that academic research could lead to significant reform. Despite the apparent need for research on personal bankruptcy, the number of academic papers on this topic is quite limited when compared to the literature on its more seductive cousin, the Chapter 11 reorganization. We hope that this paper, to our knowledge the first to study the effects of personal bankruptcy on mortgages, motivates additional research in this area.

Concordant Pairs = 63.7%
Discordant Pairs = 35.4%
Tied Pairs = 0.9%

LR Test of Regressors: 13111.9 (p=0.0001)

Notes: Table 4 presents binary logit estimates for the probability of being turned down on a mortgage application. Exemption refers to the homestead exemption available in bankruptcy in the relevant state. A pair of observations is defined as concordant (discordant) if the observation with the larger (smaller) response has a larger predicted probability. LR test indicates the chi-square statistic for joint significance of all regressors.

Table 5. State-level Fixed Effects Regression Estimates
Homestead Exemptions

Hausman test: $\chi^2(6) = 32.27$, P-value = [.000]

Notes: Linear regression model estimates of state-level mortgage rates and average mortgage loan to value ratios. Hausman (1978) test indicates specification test of random effects model against the alternative of the fixed effects model.

Table 6
Probabilities of Denial of a Mortgage Application

for Typical Consumers

	South Carolina	Delaware	West Virginia	Mississippi
Homestead Exemption	5,000	10,000	15,000	150,000
Personal Property Exemption	5,400	10,000	19,200	20,000

Estimated Probabilities

	Low Income	.224	.208	.222	.199
	Middle Income	.211	.195	.209	.187
	High Income	.146	.134	.144	.128

Estimated Percentage Changes in Probabilities

Quadruple Homestead Exemption	Low Income	-0.37	-0.76	-1.12	-11.1
	Middle Income	-0.38	-0.77	-1.34	-11.2
	High Income	-0.41	-0.83	-1.23	-11.9
Quadruple Property Exemption	Low Income	1.39	2.54	5.02	5.40
	Middle Income	1.42	2.69	5.11	5.49
	High Income	1.54	2.90	5.56	5.91

Notes: Probabilities are fitted values from logit regression results shown in Table 4. Income levels are defined as less than \$24,999, between \$25,000 and \$49,999 and more than \$50,000. Each income category contains roughly one third of U.S. families (see Kennickel, Starr-McCluer and Sunden (1997). Loan-to-income ratios are set equal to the median values taken from the 1995 HMDA data for each income level.

Table 7
Rates and Terms of a Mortgage Application
for Typical Consumers

	South Carolina	Delaware	West Virginia	Mississippi
Homestead Exemption	5,000	10,000	15,000	150,000
Personal Property Exemption	5,400	10,000	19,200	20,000

Estimated Rates and Terms				
Rates	7.79	7.54	7.91	8.23
LTV Ratios	84.3	83.0	79.5	81.0

Estimated Percentage Changes in Rates and Terms					
Quadruple Homestead Exemption	Rates	-.070	-.144	-.206	-1.97
	LTV Ratios	-.014	-.029	-.045	-.440
Quadruple Property Exemption	Rates	.377	.722	1.32	1.32
	LTV Ratios	-1.24	2.30	-4.61	-4.70

Notes: Mortgage Rates and Loan-to-Value ratios are fitted values from logit regression results shown in Table 4. Income levels are defined as less than \$24,999, between \$25,000 and \$49,999 and more than \$50,000. Each income category contains roughly one third of U.S. families (see Kennickel, Starr-McCluer and Sunden (1997)). Loan-to-income ratios are assumed equal to the median calculated from the 1995 HMDA data.

Appendix 1

The Effect of Changes in the Property Exemption

Expected Return on a Mortgage Loan

Let $f(h)$ and $j(k)$ represent the densities of h and k , respectively. Suppressing the dependence of b on X_p , X_h , g , h , and k for notational simplicity, the mortgage creditor's expected return can be now written as follows:

$$E(R) = \int_{h=0}^{M-v} \left(\int_{k=0}^{K_d(X_h, X_p, g, h)} ((b(F_7 - C_{7f}) + (1-b)(F_n - C_{nf})))j(k)dk + \int_{k=K_d}^{K} (M - C_r(k - U - M))j(k)dk \right) f(h) dh +$$

$$\int_{h=M-v}^{M+X_h} \left(\int_{k=0}^{M-X_p} (b(F_7 - C_{7f}) + (1-b)(F_n - C_{nf}))j(k)dk + \int_{k=M-X_p}^{(M-X_p)/g} (b(M - C_{7r}(k + X_p - M)) + (1-b)(F_n - C_{nf}))j(k)dk \right) f(h) dh +$$

$$\int_{h=M-v}^{M+X_h} \left(\int_{k=(M-X_p)/g}^{K_d} (b(M - C_{7r}) + (1-b)(M - C_{nr}(gk + X_p - M)))j(k)dk + \int_{k=K_d}^K (M - C_r)j(k)dk \right) f(h) dh +$$

$$\int_{h=M+X_h}^H \left(\int_{k=0}^{h-X_h-X_p} (b(F_7 - C_{7f}) + (1-b)(F_n - C_{nf}))j(k)dk + \int_{k=h-X_h-X_p+R_{13}}^{K_d} (b(M - C_{13}(k + X_p + X_h - h - M - R_{13})) + (1-b)(M - C_{nf}))j(k)dk + \int_{k=K_d}^K (M - C_r(k - U))j(k)dk \right) f(h) dh$$

Proof of Proposition 1

By straightforward application of Leibniz's rule, the derivative of the lender's expected return, $E(R)$ with respect to X_h can be written as

$$\int_{h=M+X_h}^H \left[\int_{k=0}^{h-X_h-X_p} b_{X_h}(F_7-F_n+C_{nf}-C_{7f})j(k)dk + \int_{k=h-X_h-X_p}^{K_d} b_{X_h}(M-F_n+C_{nf}-C_{13})+b(dC_{13}/dX_h)j(k)f(h) dk \right] dh +$$

$$\int_{h=M+X_h}^H [j(R_{13}+h-X_h-X_p)b(M-F_7+C_{7f}-C_{13})+j(K_d)(dK_d/dX_h)((1-b)(M-F_n)+C_r-bC_{13}-(1-b)C_{nf})]f(h)dh +$$

$$f(M+X_h) \left[\int_{k=M-X_p}^{M-X_p+R_{13}} b(M-F_7+C_{7f}-C_{7r})j(k)dk + \int_{M-X_p+R_{13}}^{K_D} b(C_{13}-C_{7r})j(k)dk + \int_{k=(M-X_p)/g}^{K_D} (1-b)(M-F_n+C_{nf}-C_{nr})j(k)dk \right]$$

It remains now to sign the terms of the derivative. We maintain throughout that of $b_{Ep} > 0$, the probability of filing is increasing in the exemption. Assumptions one through three imply that every term from above is positive save one, $(1-b)(F_N - M) + C_r - b C_{13} - (1-b)C_{nf}$.

The positivity of this term follows from assumption four. To see this, note that if $F_N < M$, $(dK_D/dX_h) = 0$ as the debtor will only consider the homestead exemption if the mortgage creditor is repaid in full and he will receive some distribution after foreclosure. Therefore, the sign of this term depends again on the relative transactions costs. Because $C_{13} < C_r$, this is positive as long as b is sufficiently close to one. This will hold when v is large relative to R_{13} and T_{13} is small relative to T_N . QED.

Proof of Proposition 2

The derivative of the home mortgage lender's expected return, $E(R)$, with respect to X_p gives:

$$\int_{h=0}^{M-v} (M-bF_7-(1-b)F_n+C_r-bC_{7f}-(1-b)C_{nf})j(K_d)(dK_d/dX_p)f(h)dh + \quad (14)$$

$$\int_{h=M-v}^{M+X_h} (C_r-bC_{7r}-(1-b)C_{nr})j(K_d)(dK_d/dX_p)f(h)dh + \quad (15)$$

$$\int_{h=M+X_h}^H ((1-b)(M-F_n)+C_r-bC_{13}-(1-b)C_{nf})(dK_d/dX_p)j(K_d)f(h)dh+ \quad (16)$$

$$\int_{h=0}^{M-v} \left(\int_{k=0}^{K_d} (b_{X_p}(F_7-F_n+C_{nf}-C_{7f})+b(dF_7/dX_p)+(1-b)(dF_n/dX_p))j(k)f(h)+ \quad (17)$$

$$\int_{h=M-v}^{M+X_h} \left(\int_{k=0}^{M-X_p} (b_{X_p}(F_7-F_n+C_{nf}-C_{7f})+b(dF_7/dX_p)+(1-b)(dF_n/dX_p))j(k)f(h)+ \quad (18)$$

$$\int_{h=M-v}^{M+X_h} \left(\int_{k=M-X_p}^{(M-X_p)/g} (b_{X_p}(M-F_n+C_{nf}-C_{7r})+(1-b)(dF_n/dX_p)+b(dC_{7r}/dX_p))j(k)f(h)+ \quad (19)$$

$$\int_{h=M+X_h}^H \left[\int_{k=0}^{R_{13}+h-X_h-X_p} b_{X_h}(F_7-F_n+C_{nf}-C_{7f})j(k)dk+ \int_{k=h-X_h-X_p}^{K_d} (b_{X_p}(M-F_n+C_{nf}-C_{13})+b(dC_{13}/dX_p))j(k)dk \right] f(h)dh+ \quad (20)$$

$$\int_{h=M+X_h}^H j(R_{13}+h-X_p-X_h)b(M-F_7+C_{7f}-C_{13})f(h)dh+ \quad (21)$$

$$\int_{h=M-v}^{M+X_h} [j(M-X_p)(b(M-F_7+C_{7f}-C_{7r}))+ (1/g)(j(M-X_p)/g)((1-b)(M-F_n+C_{nf}-C_{nr}))]f(h)dh. \quad (22)$$

This unwieldy expression confirms that a change in X_p has a much more ambiguous effect. Personal property exemptions enhance the debtor's wealth but also endanger deficiency judgments. Specifically, lines 14-16 indicate that larger personal property exemptions increase the chance that the debtor will default on his unsecured loans. In addition, a change in X_p may now affect the debtor's willingness to repay his loans when the mortgagor is undersecured. If the debtor chooses to default on the mortgage creditor as well, the mortgagor will not be repaid in full. In addition, a rise in X_p will weaken the power of the mortgagor to seek a deficiency judgment which is reflected by the fall in D as X_p rises.

Lines 17-19 represent the effect of a rise in X_p to cause more bankruptcies. As stated when discussing a change in the homestead exemption, an increase in bankruptcy filings may be good for the secured component of the loan through superior foreclosure procedures ($F_7 > F_n$) and ($C_{7f} < C_{nf}$) and a greater ability of the debtor to reaffirm the mortgage. However, bankruptcy is bad for the unsecured portion of the loan, if it exists. That is, $D_n > D_7$ due to a lack of garnishment and an increase in X_p directly weakens the return to a deficiency judgment. Again, this was not an issue with the homestead exemption as a change in X_h only has an effect on the debtor's decision when the mortgage creditor is fully secured.

Turning to lines 20-22, the personal property exemption increases the total wealth that the debtor has available to repay his mortgage or repay his unsecured creditors in return for retaining possession of the home. As X_p rises, foreclosure becomes less likely. This may be especially important when the mortgage is undersecured but the debtor's private valuation exceeds the mortgage, $M - v < h < M + Q$. In this case, a debtor able to repay results in full repayment while foreclosure may result in a substantial loss.
